

## Brainstorming & Idea Prioritization Template

|                      |                                               |
|----------------------|-----------------------------------------------|
| <b>Date</b>          | 23 July 2026                                  |
| <b>Team ID</b>       | -                                             |
| <b>Project Name</b>  | India's Agricultural Crop Production Analysis |
| <b>Maximum Marks</b> | 3 Marks                                       |

### Step 1: Brainstorm and Idea Listing

Each team member lists out as many ideas as possible without judging them at this stage.

| S.No | Team Member | Idea / Suggestion                                                         | Category                       | Group No. |
|------|-------------|---------------------------------------------------------------------------|--------------------------------|-----------|
| 1    | Member 1    | Analyze crop production trends across different Indian states             | Agriculture / Data Analytics   | 1         |
| 2    | Member 2    | Predict future crop yields using historical production data               | Agriculture / Machine Learning | 1         |
| 3    | Member 3    | Compare seasonal crop production (Kharif, Rabi & Zaid)                    | Agriculture / Data Analysis    | 1         |
| 4    | Member 4    | Identify factors affecting crop production such as rainfall and soil      | Agriculture / AI               | 1         |
| 5    | Member 5    | Create interactive dashboards for crop production visualization           | Data Visualization             | 1         |
| 6    | Member 6    | Recommend suitable crops based on production trends and regional analysis | Agriculture / Decision Support | 1         |

### Step 2: Idea Prioritization

Rate each grouped idea on feasibility and importance, then select the final idea(s) to move forward with.

| Group No. | Final Idea                                                                                                                                      | Feasibility (High/Medium/Low) | Importance (High/Medium/Low) | Priority (1 = Highest) | Selected (Yes/No) |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|------------------------------|------------------------|-------------------|
| 1         | Analyze India's agricultural crop production using historical data to identify trends, compare state-wise production, and predict future yields | High                          | High                         | 1                      | Yes               |
| 2         | Develop an interactive dashboard for crop production visualization                                                                              | High                          | Medium                       | 2                      | No                |
| 3         | Analyze seasonal crop production and recommend suitable crops                                                                                   | Medium                        | High                         | 3                      | No                |

Selected Final Idea(s):

- Analyze India's agricultural crop production using historical data to identify trends, compare state-wise production, and predict future crop yields.
